# Introduction

# Introduction

water  
rich  
region

strength of  $\nu_{ice} OH \geq$  strength of  $\nu_{weakly} OH$  ??

# Introduction

## Condon approximation :

assume the **OH transition dipole** is independent of the solvent degrees of freedom

(S. Mukamel, *Principles of Nonlinear Optical Spectroscopy*, Oxford Univ. Press, New York, 1995)

**Question** : increase in the integrated intensity of OH spectral line shape as hydrogen bonding strength increase

**non-Condon effect** : from a theoretical perspective by Skinner and coworkers

(*J. Chem. Phys.* **109**, 6154 (2005), *J. Chem. Phys.* **123**, 044513 (2005))

# Experiments & Sample & Detector

experiments & sample for the IR and Raman

IR : collected on a Thermo Electron spectrometer ( $2 \text{ cm}^{-1}$  resolution)

Raman : 514.5 nm line of an  $\text{Ar}^+$  ion laser (by Saykally and coworkers)

sample cell : 1 mm  $\text{CaF}_2$  window with  $50 \mu\text{m}$  spacer

sample & detector for the echo signal

HOD in  $\text{D}_2\text{O}$  : **flowed as a  $50 \mu\text{m}$  jet**

- to avoid the generation of any non-resonant signal from the sample cell

2%  $\text{H}_2\text{O}$  in  $\text{D}_2\text{O}$

- OD of  $\nu\text{OH} \sim 0.4$

# Theory & Simulation

$$\mu = \mu(q_0) + \left. \frac{\partial \mu}{\partial q} \right|_{q=q_0} q + \left. \frac{\partial^2 \mu}{\partial q \partial Q} \right|_{q=q_0, Q=Q_0} qQ + \dots$$

$q$  : intramolecular OH coordinate

$Q$  : refers to the bath coordinates

$\left. \frac{\partial \mu}{\partial q} \right|_{q=q_0}$  : transition dipole moment independent on the bath coordinates

$\left. \frac{\partial^2 \mu}{\partial q \partial Q} \right|_{q=q_0, Q=Q_0}$  : transition dipole moment dependent on the bath coordinates

For the **OH stretch** of HOD, it is now well established that the dominant interaction of the OH coordinate with the intermolecular degrees of freedom is expressed through the electric field  $E$  that the surroundings exert on  $q$ .

Therefore, **we equate  $Q$  with  $E$** .

\*( $E \propto \omega_{OH}$ )

# Theory & Simulation

$$\mu = \mu(q_0) + \left. \frac{\partial \mu}{\partial q} \right|_{q=q_0} q + \left. \frac{\partial^2 \mu}{\partial q \partial Q} \right|_{q=q_0, Q=Q_0} qQ + \dots$$

$$\mu_{10}(\omega) = \mu_1 + \mu_2 \cdot (\omega - \omega_g)$$

gas phase frequency

$$\gamma \equiv \left( \frac{|\mu_2|}{|\mu_1|} \right) \cdot \Delta\omega$$

⇒  $\gamma \ll 1$  : Non-Condon Effect (NCE) is negligible

# Theory & Simulation

## Absorption line shape (from the linear response function)

- just 1 degree of freedom : OH stretching vibration  
(ignoring population relaxation and reorientation)
- including the Non-Condon effects (NCE)

## Raman polarizability : largely **independent of hydrogen bonding strength**

(- S. A. Corcelli, J. L. Skinner, *J. Chem. Phys.* **109**, 6154 (2005))

$$\left\{ \begin{array}{l} I_{IR}(\omega) = \text{Re} \left[ \int_{-\infty}^{+\infty} dt e^{i\omega t} \left\langle \mu_{10}(t) \mu_{10}(0) \cdot \exp \left[ -i \int_0^t d\tau \omega_{10}(\tau) \tau \right] \right\rangle \right] \\ I_R(\omega) = \text{Re} \left[ \int_{-\infty}^{+\infty} dt e^{i\omega t} \left\langle \alpha_{10}(t) \alpha_{10}(0) \cdot \exp \left[ -i \int_0^t d\tau \omega_{10}(\tau) \tau \right] \right\rangle \right] \end{array} \right.$$

# Theory & Simulation

$$I_{IR}(\omega) = \text{Re} \left[ \int_{-\infty}^{+\infty} dt e^{i\omega t} \left\langle \mu_{10}(t) \mu_{10}(0) \cdot \exp \left[ -i \int_0^t d\tau \omega_{10}(\tau) \tau \right] \right\rangle \right]$$
$$I_R(\omega) = \text{Re} \left[ \int_{-\infty}^{+\infty} dt e^{i\omega t} \left\langle \alpha_{10}(t) \alpha_{10}(0) \cdot \exp \left[ -i \int_0^t d\tau \omega_{10}(\tau) \tau \right] \right\rangle \right]$$

experimentally observed frequency- and temperature-dependent absorption coefficient

$$\sigma_{IR}(\omega) \propto \omega(1 - e^{-\beta h\omega}) I_{IR}(\omega)$$

(R. Zwanzig, *Nonequilibrium Statistical Mechanics*, Oxford Univ. Press, Oxford, 2001)

observed Raman scattering intensity for incoherent Stokes scattering

$$\sigma_R(\omega) \propto (\omega_L - \omega)^4 (1 - e^{-\beta h\omega})^{-1} I_R(\omega)$$

(D. A. McQuarrie, *Statistical Mechanics*, Harper and Row, New York, 1976,

G. E. Walrafen, M. R. Fischer, M. S. Hokmabadi, W. -H. Yang, *J. Chem. Phys.* **85**, 6970 (1986))

# Theory & Simulation

$\mu_{SK}$  : frequency-dependent transition dipole

-(calculated by Skinner and coworkers)

$\mu_{emp}$  : frequency-dependent transition dipole

-(determined from the ratio of the IR and Raman)

$$|\mu_{emp}(\omega)| \propto \sqrt{\frac{I_{IR}(\omega)}{I_{Raman}(\omega)}} \propto \sqrt{\frac{\sigma_{IR}(\omega)}{\sigma_{Raman}(\omega)} \cdot \frac{\omega}{(\omega_L - \omega)} (1 - e^{-\beta h \omega})^2}$$

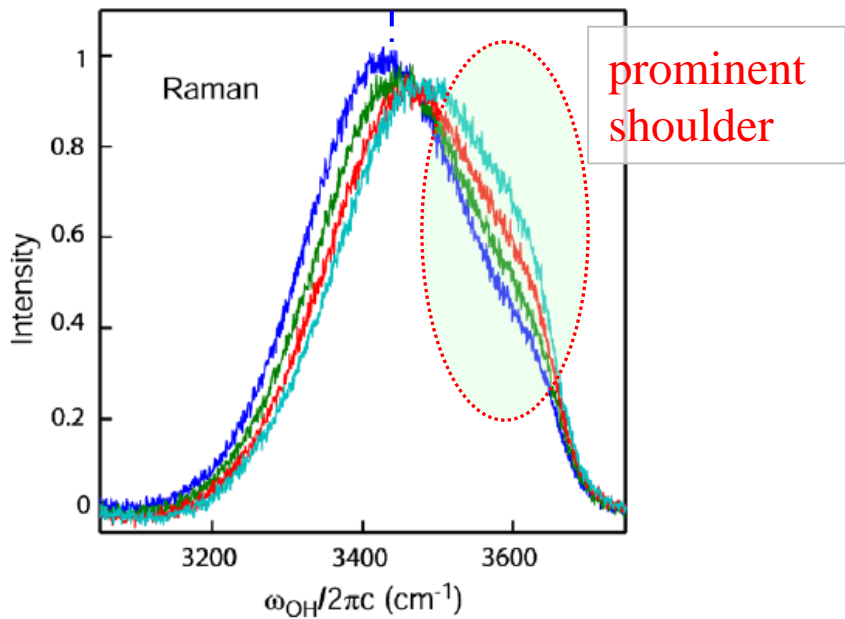

$\mu_{SK2}$  : frequency-dependent transition dipole

-(calculated by Skinner and coworkers, twice the slope)

# Introduction - echo signal

J. Chem. Phys. **122**, 054506 (2005)

Top: Examples of normalized vibrational echoes in the  $k_+$  and  $k_-$  wave vector geometries for the indicated waiting times. For each  $\tau_2$ , the value of  $\tau_1^*$  is obtained by fitting both echoes with Gaussian functions (black lines) to determine the time interval between peak positions.

Bottom: The PS decay (squares) is plotted along with the best fit (black line).

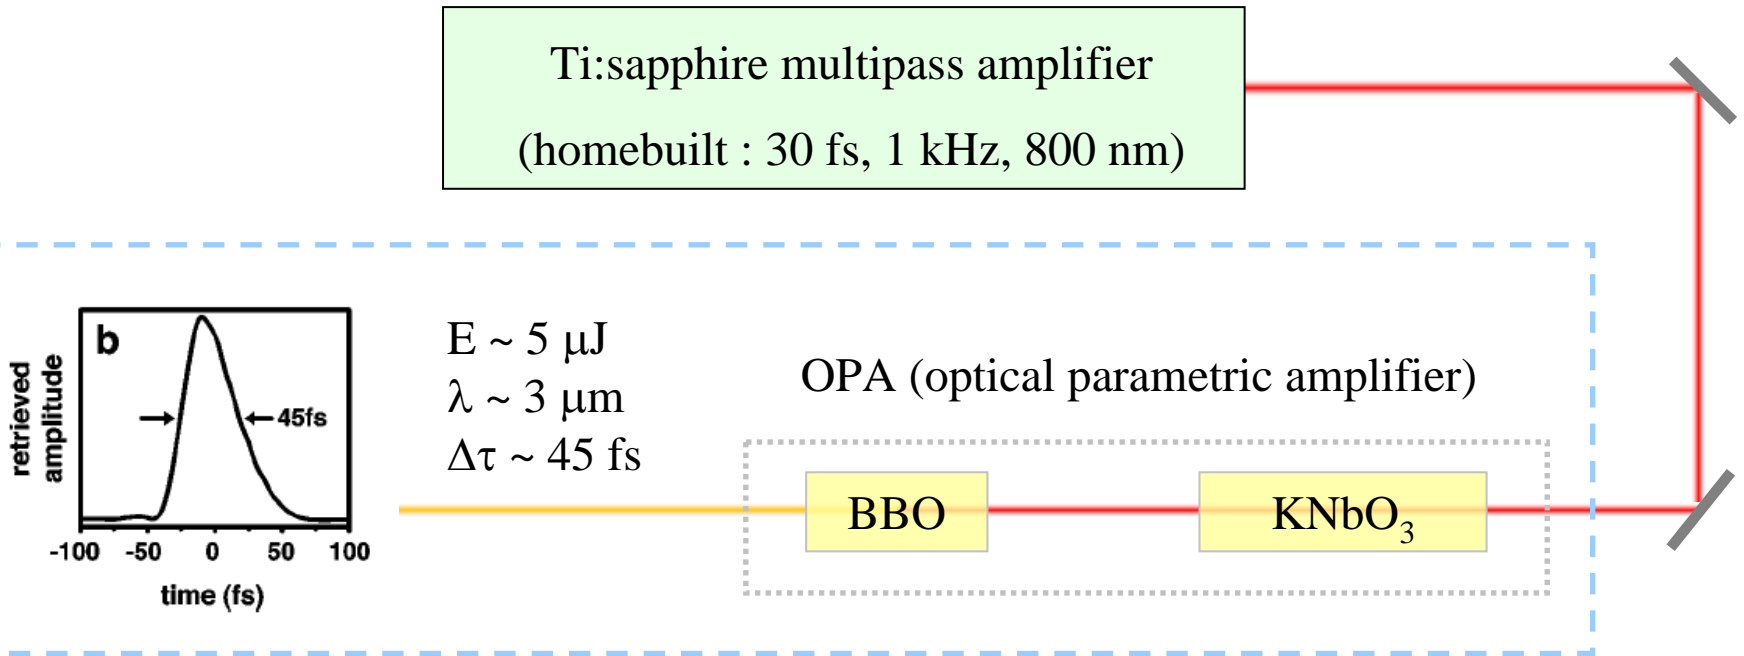

In the inset, the absorption spectrum calculated from the extracted dynamical quantities (dashed line) is superimposed on the experimental spectrum.

$$k_+ : -k_\alpha + k_\beta + k_\gamma$$

$$k_- : k_\alpha - k_\beta + k_\gamma$$

# Introduction - Frank-Condon principle

[http://en.wikipedia.org/wiki/Franck-Condon\\_principle](http://en.wikipedia.org/wiki/Franck-Condon_principle)

The **Frank-Condon principle** is a rule in [spectroscopy](#) and [quantum chemistry](#) that explains the intensity of [vibronic transitions](#). Vibronic transitions are the simultaneous changes in electronic and vibrational energy levels of a molecule due to the absorption or emission of a [photon](#) of the appropriate energy. The principle states that during an [electronic transition](#), a change from one [vibrational energy level](#) to another will be more likely to happen if the two vibrational [wave functions](#) overlap more significantly.
